

Configure the Paystack Food-Order Webhook

Ensure completed restaurant food-order payments are recorded even when a guest does not return to the payment callback page.

Before you begin

Your Laravel app must be deployed on a publicly accessible HTTPS domain. Localhost URLs cannot receive Paystack webhooks.

Webhook URL

```
https://hotel.example.com/payments/paystack/restaurant-orders/webhook
```

Replace **hotel.example.com** with the real public domain for this application. Do not use the literal placeholder URL.

Configure Paystack

1	Log in to the Paystack Dashboard .
2	Choose Test mode while testing, or Live mode before accepting real payments.
3	Open Settings , then select API Keys & Webhooks .
4	Paste the complete webhook URL into the Webhook URL field.
5	Save the setting. Paystack will send successful food-order payments to this endpoint as a charge.success event.

Confirm the application secret key

The webhook validates the x-paystack-signature header using the Paystack secret key configured for the active server environment:

```
PAYSTACK_SECRET_KEY=sk_test_your_key_here
```

```
PAYSTACK_SECRET_KEY=sk_live_your_key_here
```

Use the test key in Test mode and the live key in Live mode. Never commit either secret key to Git or place it in frontend code.

```
php artisan config:clear
```

Run this command after changing .env when Laravel configuration caching is enabled.

Verification checklist

1.	Create a small restaurant food order in Test mode.
2.	Complete the payment using Paystack test details.
3.	Confirm the food order changes to Paid/Confirmed and one payment record is created.
4.	Confirm the kitchen receives the order notification when kitchen permissions are configured.

Security and hosting notes

The endpoint accepts POST requests only, excludes browser CSRF validation for Paystack, and rejects requests whose HMAC SHA512 signature does not match the request body. If your hosting firewall restricts inbound requests, allow Paystack webhook traffic while keeping signature validation enabled.
